

Introduction to Git and Github

Joachim Mammele

What is Git?

- Most commonly used version control system
 - Tracks changes you or anybody else makes to files
 - Provides a record of what has been done
 - Allows to revert to previous versions
 - Makes collaboration easier when several people work simultaneously on the same code base
- 

Repositories

- ▶ Container for a project that is tracked by git
- ▶ Local repository
 - ▶ Isolated repository stored on your own computer
 - ▶ Allows you to work on the local code version
- ▶ Remote repository
 - ▶ Stored outside of your own computer
 - ▶ Usually on a remote server (github, gitlab, bitbucket)
 - ▶ Easies up collaboration with others, eg. Code review

Basic usage

- ▶ Initialize a repository
 - ▶ Command: `git init`
 - ▶ Creates a hidden `.git` folder in which all relevant information is stored
- ▶ Check for changes in repository
 - ▶ Command: `git status`

Basic usage

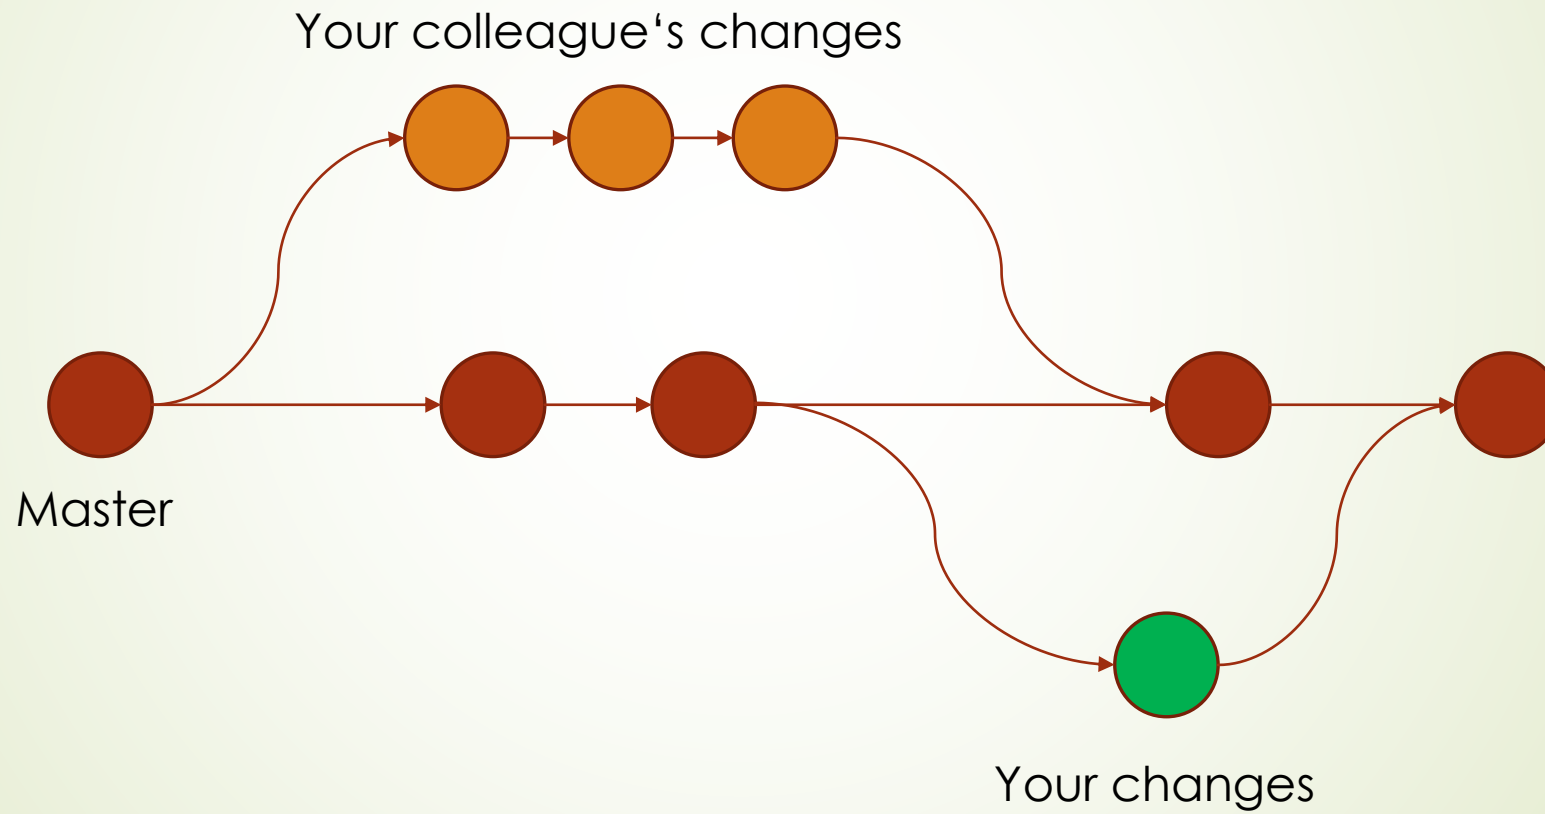

- ▶ Stage files
 - ▶ Makes git aware to monitor new files
 - ▶ Command: `git add filename`
- ▶ Commit files
 - ▶ Creates a snapshot of current code changes
 - ▶ Command: `git commit -m „my changes“`
- ▶ Show history of changes
 - ▶ Command: `git log`

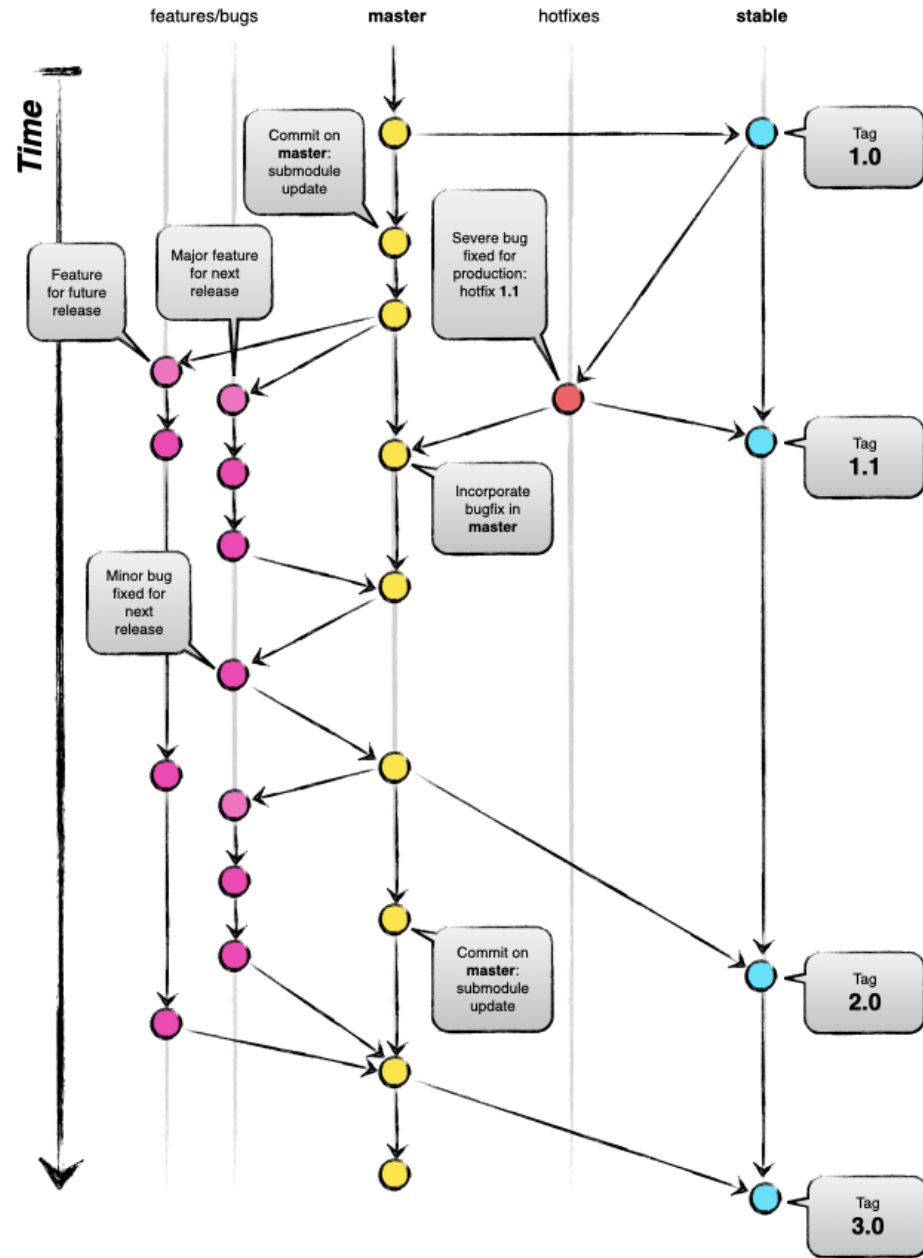

Branches

- ▶ Allow to group changes
- ▶ Branches are created when working on
 - ▶ New features
 - ▶ Bugfixes
 - ▶ Doing quick experiments
- ▶ Help to keep the main code base clean
- ▶ Default branch is usually called „main“ or „master“

Branches - Usage

Further commands

- ▶ Merge
 - ▶ Process of bringing changes from a branch back to main
- ▶ Pull
 - ▶ Process of bringing changes from remote repository into the local repository
- ▶ Push
 - ▶ Process of bringing changes from local repository into the remote repository
- ▶ Pull requests
 - ▶ Allow to discuss/ code review changes before merging them into the main branch
 - ▶ Can be combined with automatic code checks (linting) and testing
 - ▶ Changes can only be merged if code is
 - ▶ Approved by maintainer
 - ▶ (Automatically) tested
 - ▶ Complies with coding rules

Branches - Usage

- ▶ Create a new branch and directly switch to it
 - ▶ Command: `git checkout -b branch-name`
- ▶ Switch to an already existing branch
 - ▶ Command: `git checkout branch-name`

Fork

- Copy of the whole repository
- Managed by you and not the original maintainer
- Allow to make changes without affecting the original repository
- You can fetch updates from or submit changes to the original repository with pull requests.
- Problem: with the time forks get outdated if not synched regularly

Taking it one step further

- ▶ Continuous Integration

- ▶ Developers merge their changes back to the main branch as often as possible
- ▶ Changes are validated by creating a build from them and running automatic tests
- ▶ Helps to avoid problems when branches with big changes need to be merged a few days before release day

- ▶ Continuous Delivery

- ▶ Extension of the previous one
- ▶ Deploys all changes automatically to a testing and/or production environment after successful building and testing

- 
- Screenshot of gitlab – removed for online version
- 

Github Pages

- ▶ Automatically generate a website from your source code
- ▶ Slogan: Just edit, push – and your changes are live
- ▶ Example:
 - ▶ Website for the Latin-American ICCM
 - ▶ URL: <https://cicm-al.org>
 - ▶ Repository: <https://github.com/cicm-al/cicm-al.github.io>

Questions?

Hands-On Part

- ▶ Let's suppose we are a development team and need to work together on the same source code base
- ▶ We want to generate a calculator that sums up all numbers contained in different files
- ▶ Task:
 - ▶ Add your own file with a number on a branch
 - ▶ Create a pull request on github
 - ▶ Verify that build succeeds

```
▶ Run python calculator.py
Reading content of file test_file.txt
53
33
3

Reading content of file textfile1.txt
479
44

Reading content of file mysupernumber.txt
997

*****
Summary of all numbers in all files is: 1609
*****
```
